dTRANS T03 J
 Type 707030/...

Brief description

These transmitters are designed for industrial applications and are used to measure the temperature through Pt100 resistance thermometers in 2-/3-wire circuit connections. The 4 – 20 mA or 0 – 10 V output signal is linear with temperature. The continuous analog signal path enables an extremely fast reaction time of the output to a change in temperature (continuous analog measurement instead of digital sampling rate), resulting in a low-noise output signal that is insensitive to interference. A very high degree of precision - even with small ranges - is ensured thanks to the range-specific gain adjustment. Digital communication allows the transmitter to be adapted to the measurement task (range, probe break and fine calibration).

dTRANS T03 B
 Type 707031/...

Two versions are available to suit specific requirements:

Instruments with basic type extension 880/990 (adjustable)

The transmitters are calibrated for a fixed range but can, at any time, be calibrated for a different range through the PC setup program.

Instruments with basic type extension 881/991 (configurable)

The required range can be configured through the PC setup program, without sensor simulation and measurement.

Connection example

Setup program (for all types)

The setup program is available for calibrating/configuring the transmitter from a PC.

Connection is through a PC interface (including power supply and adapter) and the setup interface of the transmitter. In order to calibrate/configure the transmitter, it has to be connected to the supply voltage. If no power supply or supply isolator is available, Types 707030/..., 707031/... and 707032/... can be supplied from a 9V block battery.

Adjustable/configurable parameters

- TAG number (8 characters)
- response to probe and cable break
- range start, range end
- lead resistance for 2-wire circuit

Fine calibration

Fine calibration means adjustment of the output signal of a calibrated/configured transmitter. Errors due to the system (such as an unfavorable probe installation) can be compensated. The signal can be adjusted in the range $\pm 0.2\text{mA}$ for current output and $\pm 0.1\text{V}$ for voltage output. Negative output voltages are not possible with voltage output. Fine calibration can only be carried out through the setup program.

Hardware and software requirements

The following hardware and software requirements have to be met for installing and operating the setup program:

- IBM-PC or compatible PC from 486DX-2-100
- 64 MB main memory
- 10MB available on hard disk
- CD-ROM drive
- 1 free serial interface
- Win 98, ME or Win NT4.0, 2000, XP

Connection layout for calibrating/configuring the dTRANS T03 B and BU

Range organization

All the possible range-start values in relation to the range span are contained within the gray area.

$$\text{range span} = \text{range end} - \text{range start}$$

Example: range start = -50°C, range end = 250°C
 range span = range end - range start = 250°C - (-50°C) = 300°C

Caution: When selecting the range start, make sure it lies within the gray area.

Please note: for spans smaller than 75°C, the only permissible start values are: -40°C, -20°C, 0°C, +20°C and +40°C.
